ITCC
Intelligent Torque-controlled Coupling
Active on-demand AWD system
Stable, Smooth and Highly Efficient Transmission of Power Expanding the possibilities of AWD

Weather conditions, vehicle use, driver’s intentions… Calculating every element to ensure that all four tires are firmly hugging the road under ever-changing conditions. Expanding the ability of more and more vehicles to give the driver that true feeling of confidence and driving pleasure. Our goal is to deliver that experience to everyone!

With this in mind, JTEKT has reduced size and weight while simultaneously improving reliability in the production of ITCC*: electronically controlled coupling for AWD vehicles.

Continuing the Evolution of JTEKT ITCC

Excellent response and powerful torque drawing the maximum potential of all four wheels

AWD market trends

ITCC History

From differential-sensitive on-demand coupling (RBC) to the recently developed active on-demand AWD system (ITCC), automotive manufacturers around the world are using JTEKT AWD systems.

ITCC Evolution

Continuously evolving since beginning of mass-production, the third-generation system (Gen 3) introduces epoch-making improvements in performance and durability.

The continuous evolution of active on-demand AWD is based on a quest with a single theme: consideration of every aspect to deliver optimum torque to each of the four wheels, front and back, left and right. At the core of this torque management is JTEKT’s electronically controlled AWD coupling, ITCC. It is capable of responding instantaneously, safely and controllably, ITCC offers continuous control of the driving force delivered to the front and rear wheels, from 100:0 (front:rear) to 50:50 (front:rear). As a result of the unparalleled results achieved for both high fuel efficiency and traction performance, ITCC is now installed in many AWD vehicles, and holds No. 1 market share in the world. Its superior installation ease, drive force transfer efficiency and wide-ranging load capacity are key factors supporting the development of AWD systems.

**ITCC Installation Layout**

In vehicles with a FWD configuration, the ITCC is installed in front of the rear differential; the active on-demand (active torque split) AWD system providing optimum torque distribution to the front and rear wheels. This contributes to ensuring both high fuel efficiency and superior driving performance.

**ITCC Operating Principle**

Based on signals from each sensor in the vehicle, such as wheel speed sensors, etc., the ECU analyzes driver operation and road surface conditions, and then ITCC transfers the appropriate torque to the output shaft according to the electrical current from the ECU.

Example of on-demand AWD mounted in FWD configuration

In this mounting example, the ITCC is located in front of the rear differential and the vehicle normally runs with the front-wheel-drive. The ECU receives signals from each sensor, analyzes driving and road surface conditions, and controls the electrical current sent to the ITCC, which then transfers the optimal torque to the rear wheels based on various conditions.

**ITCC structure**

- Electromagnetic clutch adopted, realizing reductions in size and weight.
- Components broadly divided into five sections: Input case, main clutch, electromagnetic clutch, cam mechanism and output shaft.

**Example of on-demand AWD mounted in FWD configuration**

In this mounting example, the ITCC is located in front of the rear differential and the vehicle normally runs with the front-wheel-drive. The ECU receives signals from each sensor, analyzes driving and road surface conditions, and controls the electrical current sent to the ITCC, which then transfers the optimal torque to the rear wheels based on various conditions.

**When in 2WD (normal driving)**

ECU automatically analyzes signals from wheel speeds and other sensors, and continuously adjusts the driving force (e.g., 100:0~50:50) to the front and rear wheels according to driver operation and road surface conditions.

**When in AWD (front wheels slip)**

ECU receives signals from each sensor, analyzes driving and road surface conditions, and controls the electrical current sent to the ITCC, which then transfers the optimal torque to the rear wheels based on various conditions.
ITCC Features

- Optimum driving force distributed based on road surface and driving conditions
- Compact, lightweight system

Lightweight/Compact size contributes to higher fuel efficiency

Introduction of an electromagnetic clutch enabled reductions in weight, size and electricity consumption, contributing to improved fuel efficiency.

- Newly developed control clutch introduced
- Newly developed control clutch, further improved torque precision and lighter driveline contribute to higher fuel efficiency.

Superior durability and quietness have been realized, contributing to a confident, comfortable drive.

Remarkable anti-shudder performance contributes further to quietness.

- Control clutch coated with diamond-like carbon (DLC) introduced
- ITCC can be used in large-sized vehicles where the clutch is subjected to large load, and the amorphous carbon film contributes to both reducing size and increasing service life.

- Special high-performance ITCC fluid introduced
- Aiming to improve durability, a special fluid has been introduced that makes it possible to reduce the number of clutch plates to lighten the weight. Additionally, compared to conventional automatic transmission fluid (ATF), AWD coupling performance has been improved, thereby contributing to quietness of eco-cars.

Based on extensive experience, ITCC control contributes to reducing abnormal noises (e.g., driveline torsional vibration, driveline chattering, etc.) generated by the vehicle.

Driving Performance with ITCC

Traction performance

Vehicles equipped with ITCC exhibit a standing-start acceleration performance equivalent to that of rigid AWD.

Standing-start full-throttle acceleration on ice floe

ITCC: Equivalent to rigid AWD

Handling performance/Stability

Vehicles equipped with ITCC exhibit brilliant handling stability even on a slippery surface.

Neutral steer

ITCC AWD

Rigid AWD

Understeer

ITCC: Ideal neutral steer

Launch performance

Ice surface
- Acceleration: Stop ~ WOT (wide open throttle)

Cornering performance

Ice surface
- Acceleration from 30km/h

**ITCC Control System Features**

- Highly accurate control
- Driving mode judgment
- Torque vectoring unit installation example
- Using wheel speed signal, throttle position signal, etc., that come as standard equipment in the vehicle, ITCC basic control logic compatible with traction performance and tight corner binding avoidance is developed. Optional control including driveline tightening and improving vehicle vibration/noise performance is available.

In situations such as driving in the city and on snowy roads, the simple ITCC system improves vehicle controllability and contributes to safe, confident driving.

**Extended Use Example Based on ITCC**

Torque Vectorsing Unit Adaptation

In addition to the function that distributes optimum torque to the rear wheels depending on vehicle operation and driving conditions, the system can also freely distribute torque to the right and left rear wheels. When cornering, large torque can be distributed to the outer rear wheel to produce yaw moment that suppresses understeer, thereby enabling the vehicle to hold the desired cornering line. Quick response to steering operation realizes sporty handling performance.

**Ensuring the delivery of safer, more secure electronically controlled AWD couplings to customers around the world**

JTERT has been conducting activities to ensure compliance with functional safety standards in accordance with ISO26262 Road Vehicles – Functional Safety since 2005.
Fully utilizing our knowledge as a world-leading systems supplier, JTEKT conducts driving evaluations and analyses of products installed in vehicles. We exhaustively pursue the highest standards in product safety and operation on a test course capable of simulating various road and weather conditions around the world. As a total systems supplier, our highest value is to provide our customers with products that deliver outstanding performance and the best quality that help to make automobiles that are more than just fun to drive.
